

Milestone | Doordash Delivery Analysis

- All of your answers should be typed or pasted into the grey boxes.
- Questions with grey answer boxes expect a specific answer. Once you input the correct answer, the question number box **will change from blue to green**.
- Questions with yellow answer boxes are free-response questions. There will be no change in the question number boxes (in blue), regardless of your answer.
- Hover your cursor over the blue hint box to get a helpful hint!

Part 1: Calculating Delivery Time

1	In the delivery_time column, fill in the number of minutes it took between when an order was created, and when it was delivered. The elapsed time should be measured in <i>minutes</i> .	Hint!
2	What is the average number of minutes it took for orders to be delivered, across all orders in the data period?	49.9 Hint!
3	What is the standard deviation for the number of minutes it took for orders to be delivered?	21.6 Hint!
4	How do you interpret the difference between the average delivery time and the standard deviation in the context of DoorDash's service?	

Prompt ChatGPT: How do I interpret the difference between the average delivery time and the standard deviation for a Doordash order? What does it mean for the standard deviation to be large or small?

The average delivery time represents the typical amount of time it takes for an order to be delivered. The standard deviation shows how much delivery times vary from that average. A larger standard deviation suggests deliveries are less consistent, while a smaller standard deviation indicates more reliable delivery performance.

Part 2: Summarizing Market Analysis

5	To the right, create a PivotTable that summarizes the total number of orders made , the average delivery time , and the average price of orders made for each market .	Hint!
6	Which market has the highest total number of orders?	New York City
7	Which market has the lowest average delivery time?	New York City
8	Which market has the highest average order price?	Chicago
9	Consider the differences in total number of orders, average delivery time, and average order price across the markets shown in your PivotTable. What factors could explain the variations between cities?	

Differences across markets may be influenced by traffic congestion, population density, and driver availability. Higher demand during peak hours can increase delivery times, while urban layout and restaurant density may also affect efficiency. Average order values may vary due to regional income levels and restaurant pricing.

10	How can DoorDash leverage data from these markets to adjust service offerings and maximize customer satisfaction and revenue? If you need help generating ideas, use ChatGPT as your teammate to explore potential strategies, but focus on using your own analysis to determine the best actions.	
----	---	--

DoorDash could increase driver incentives in markets with longer delivery times to improve availability during peak periods. Markets with higher average order values may benefit from premium restaurant partnerships. High-volume markets could focus on operational efficiency to maintain fast delivery times.

Part 3: Adding in Cuisine Type

11	In the sheet titled Task 11 , create a new PivotTable that summarizes the total number of orders made by the primary category of each store. Sort the table by the number of orders made, in descending order.	
12	Which cuisine type is the most popular overall?	american
13	Modify the PivotTable by adding a grouping by market region to the table, and changing the count of orders to be a percentage within each market region.	Hint!

Insert a PivotTable below here for Task 5!

market	Count of market	Average of delivery_time	Average of subtotal
Boston	4729	48	\$24.45
Chicago	11785	49	\$28.87
Los Angeles	5924	51	\$25.52
New York City	14343	48	\$26.38
San Francisco	9310	55	\$27.23
Seattle	3945	50	\$24.70
Grand Total	50036	50	\$26.71

14	What percentage of orders made in Boston are from places labeled as 'chinese'?	7.25%	Hint!
15	In how many regions is the most popular overall cuisine (from Task 12) actually the most popular cuisine within an individual market region?	3	
16	Which region has the highest percentage of orders coming from a 'sandwich' shop?	seattle	
17	Based on the data in your PivotTable, provide three specific suggestions for how DoorDash should tailor its offerings to better meet the needs of customers in different regions. Each suggestion needs to be supported by a finding from your analysis.		

DoorDash could prioritize promotions for the most popular cuisines in each market to increase order volume. Markets with a high concentration of specific cuisines could benefit from targeted restaurant partnerships. Regions with lower cuisine diversity may present opportunities to expand restaurant offerings and attract more customers.

LevelUp

To improve service efficiency and customer satisfaction, which type of cuisine should DoorDash focus on improving delivery times for? For this optional LevelUp activity, create a PivotTable of the average delivery time, in minutes, by type of cuisine. Place the PivotTable in the sheet called "LevelUp!". Sort the data by delivery time and create a horizontal bar chart of the results. Highlight the cuisine with the longest average delivery time in the PivotTable, as this will help identify areas where operational improvements could lead to faster deliveries and better customer satisfaction.
